# Summary

## Cervical Screening Programme, England 2007-08

Cervical cancer deaths are falling. Women between the ages of 25 and 64 are invited for regular cervical screening under a national programme.

This is intended to detect abnormalities within the cervix that could, if untreated, develop into cancer. Women are screened every three or five years depending on their age.

### At 31st March 2008:

- Over the last ten years the percentage of eligible women who have been screened at least once in the previous 5 years (coverage) has fallen to 78.6% compared with 79.2% last year and 82.5% in 1998.
- Coverage was 80% or higher in 63 of the 152 Primary Care Organisations (PCOs), compared to 71 in the previous year.

### 2007-08

- Prior to the introduction of new technology (liquid based cytology - LBC), rates of inadequate samples were over 9% or about 300,000 women a year being screened again. As LBC has been rolled out across the country the rate has fallen every year and is now at a record low of under 3% or less than 100,000 women. (Note, these numbers will include some women who will need more than one repeat test).
- Laboratories examined 3.6 million samples (for women of all ages), about 1% fewer than in 2006-07. This is partly due to the fall in inadequate samples as LBC continues to roll out.
- The number of women invited (25-64) has risen from 4.01 to 4.18 million in the last year, an increase of 4.3%, the largest number of invitations since the introduction of the 25 to 64 target age range.
- The number of women screened (all ages) has remained almost level at 3.4 million, however those within the 25 to 64 age range have risen by 1.7% to 3.2 million.
- Test results were available for 60% of women within 4 weeks compared to 48% last year. This year we were able to break this down further with results available within 2 weeks currently at 11% but this is expected to rise.
- The percentage of laboratory tests reported within 4 weeks has continued to improve, rising from 74% last year to 83% this year, the percentage reported within 2 weeks has also risen substantially (from 43 to 49%).

# Introduction

## Cervical Screening – a general overview

**1.1** Information on the Cervical Screening Programme has been collected since 1988-89 on the following Information Centre returns:

- KC53 – information from the call and re-call system, collected from all 152 Primary Care Organisations.
- KC61 – information on screening samples examined by pathology labs, collected from 124 laboratories carrying out cervical cytology.
- KC65 – information on referrals to colposcopy and subsequent treatment and outcome, collected from 221 clinics/trusts providing colposcopy services. In some instances, smaller clinics have included their data in the main hospital return. The KC65 return was first collected in 2000-01.

**1.2** National policy for the screening programme is that eligible women should be invited for screening every 3 or 5 years. This varies according to age, women aged 25-49 are invited every 3 years, those aged 50-64 every 5 years. Since 2003, women have been eligible for routine screening from age 25 (previously age 20). In this bulletin, the target group of 25-64 has been used wherever possible.

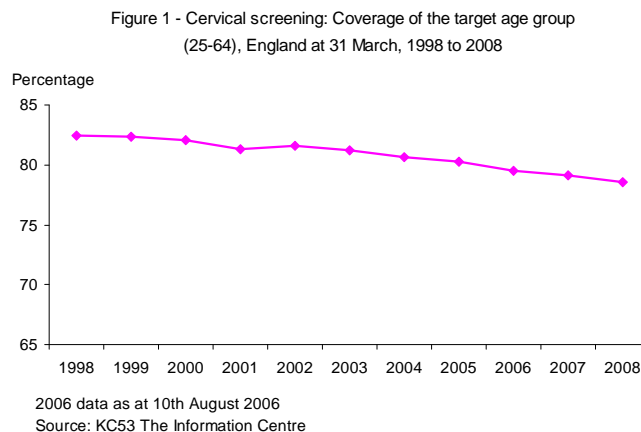

**1.3** In presenting laboratory statistics, data about samples from GP and NHS Community Clinics have been used in most tables in preference to data about samples from all sources, so as to reflect more closely the results from screening programme tests.

# Call and Recall Programme

## 2.1 Coverage (Tables 1, 2, 3, 3a, 11, 12 and 13)

**2.1.1** Of eligible women, (aged 25-64) at 31st March 2008, 78.6% were recorded as being tested within 5 years of their last adequate test (coverage). Coverage has been falling slightly over the last ten years and this is the third consecutive year it has dropped below 80%.

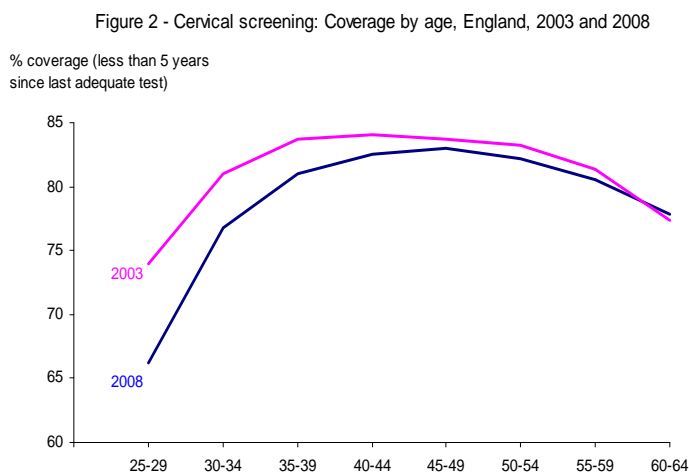

(Figure 1)

© Data prior to 2005, re-used with the permission of the Department of Health

**2.1.2** Since last year coverage has fallen throughout each age group although this is slightly more evident in younger women. Between 2003 and 2008 the only age group to show any increase are those women aged 60 to 64. (Figure 2)

**2.1.3** Coverage of the target age group 25-64 varied between Strategic Health Authorities, with 3 achieving 80% or more and 7 below. The highest reported coverage was in the East Midlands at 82.4%, the lowest was London at 73.4%. All regions show small reductions over the previous year.

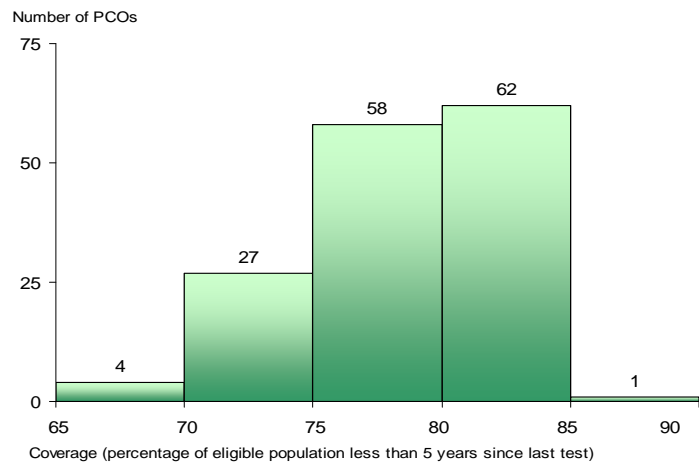

Source: KC53 The Information Centre  
© Data prior to 2005, re-used with the permission of the Department of Health

At Primary Care Organisation (PCO) level, only 1 of the 152 PCOs reported coverage of 85% or higher, 62 were between 80% and 85% and 89 were below 80%. (Figure 3 and 3a)

**2.1.4** In addition to the 73% of women in the 25-64 age group (including those with recall ceased for clinical reasons) who on 31st March 2008 were less than 5 years since their last test, a further 7.8% were within 10 years of their last test and 2.3% were within 15 years. About 1.3% of women were reported as having had at least one adequate screening test but not within the last 15 years. Only 0.2% had attended but never had an adequate test, 7.9% had been called but had never attended for screening and 0.2% of women in the target age group were reported as having no cytology record at all.

Source: KC53 The Information Centre

## 2.2 Invitations for screening (Tables 4, 5 and 11)

**2.2.1** Just over 4.3 million women of all ages were invited for screening in 2007-08, a slight increase of 0.3% compared with 2006-07. For 13% of women this was their first invitation (call) and for 66% a routine recall. About 14% of invitations were early recalls for surveillance, 4% were early recalls following persistent findings of borderline changes or mild dyskaryosis and 3% were recalls following inadequate tests.

**2.2.2** About 3.2 million women in the target age range 25-64 were tested in the year. Of these, 2.6 million were tested following an invitation within the screening programme. About 0.6 million women (20%) had screening tests not prompted by the programme, i.e. tests initiated by the sample taker or opportunistically by the woman, without her necessarily having been invited. In particular, some women are routinely recalled by their GPs possibly earlier than at the “locally” agreed standard interval. Because women recorded as having a test not prompted by the programme may nevertheless have been invited through such a GP programme, it is not possible to calculate the percentage uptake of invitations from the call/recall database.

**Figure 3a - Cervical screening: Coverage of women (less than 5 years since last adequate test) aged 25-64 by Primary Care Organisation, 2007-08**

## 2.3 Test results (Tables 5, 6, 7, 8, 11 and 12)

**2.3.1** Some women have more than one test during the year for clinical reasons and the 3.4 million women of all ages tested in 2007-08 generated 3.6 million tests. About 3% of tests do not have a result, as the sample is “inadequate” i.e. it does not contain material suitable for analysis (see 3.1.2 below for more information on inadequate samples). For women tested again due to an earlier inadequate test, 12% resulted in a repeated inadequate result, a decrease on 2006-07 (15%).

**2.3.2** Of the 3.2 million women aged 25-64, who did have a result in 2007-08, 93.4% were negative, 3.4% showed borderline changes, 2.0% showed mild dyskaryosis, 0.6% showed moderate dyskaryosis, 0.6% showed severe dyskaryosis and 0.1% showed invasive carcinoma or glandular neoplasia. Within the target age range the percentage of results which are severe or worse shows a distinct pattern by age, being highest at 1.4% for women aged 25-29, falling to 0.2% for women aged 60-64. (Figure 4)

**2.3.3** Across the country as a whole, about 6.6% of women aged 25-64, with at least one adequate test result, had a result categorised as abnormal (including severe dyskaryosis or worse). At PCO level, in 125 of the 152 PCOs the proportion of women presenting with an abnormal result was between 4% and 8%. In 1 PCO it lay below 4%; in 19 PCOs the proportion was between 8% and 10%; and in 7 PCOs the proportion lay above 10% (maximum was 12.8%). (Figure 5)

## 2.4 Time from screening to availability of result (Table 9 & 9a)

**2.4.1** Information about the time from the taking of a sample to the availability of the test result is currently available only where the result letter is produced by the Primary Care Organisation. This occurred in 94% of cases overall.

In 2007-08 it was possible for the first time to monitor how many letters were available within 2 weeks (11%), in previous years data within 4 weeks was the lowest timescale available. A further 49% were available between 2 and 4 weeks of the sample being taken. Overall therefore 60% of result letters produced

Figure 5 - Cervical screening: Percentage of tests for women aged 25-64, with an abnormal result by Primary Care Organisation, England 2007-08

Source: KC53 The Information Centre

by PCOs were available within 4 weeks, a large increase compared with last year (48%). A further 33% were available between 4 and 8 weeks, and 6% between 10 and 12 weeks. In only 2% of cases, the time to availability was over 12 weeks a similar proportion to 2006-07.

More detail is available in Table 9a which shows this data broken down by PCO. Regionally the 2 weeks availability ranged from 25% (Yorkshire & Humber) to 6% (London). The cumulative total for availability within 4 weeks ranges from 80% (East Midlands – 40% last year) to 42% (South Central – 39% last year).

## 2.5 Recall status (Table 10)

**2.5.1** Normal recall status, defined as action code A (routine recall), is normally used only where the test result is negative, however HPV sentinel sites (trialled for the first time in 2007-08) show small numbers of normal results within borderline changes and mild dyskaryosis (0.1% and 0.03% respectively). For more information on these sites go

to the NHS Cancer Screening Programme website (see further information). In 2007-08, about 86% of women who had nothing other than a negative test result in the year had a normal recall status. Almost all the remaining women with negative results (13%) had a repeat recall status due to previous history; and about 1% had a suspend recall status as they were currently under hospital care.

**2.5.2** Repeat recall status, action code R, requires a further test earlier than routine recall, typically within 6 months of the previous test. This may be used where a test result is negative, inadequate, borderline or mild dyskaryosis. In 2007-08, about 36% of women whose most severe test result in the year was mild dyskaryosis had a repeat recall status; the corresponding proportion for borderline was 78%, and for inadequate 97%. The remaining majority of women in these three groups had a suspend recall status.

**2.5.3** Suspend recall status, action code S, is an indication that recall has been suspended due to referral. This should be the only allowable status following a test result of moderate dyskaryosis or worse. In 2007-08, all women whose most severe test result in the year was moderate dyskaryosis or worse had a suspend recall status; no women were recorded with repeat recall status.

# Cervical Cytology

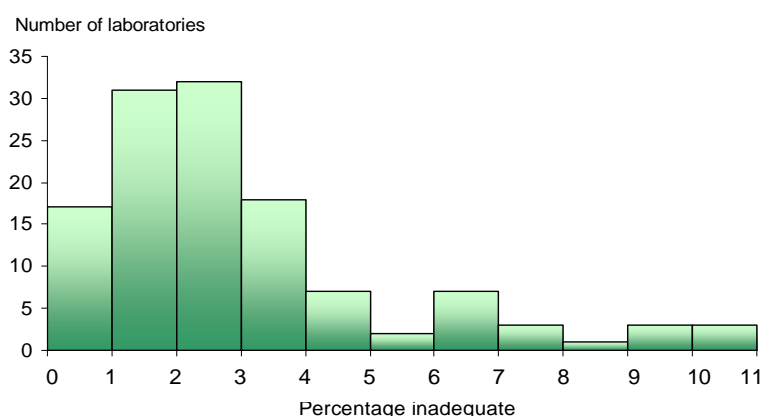

## 3.1 Samples examined (Tables 14, 15, 17 and 19)

**3.1.1** Approximately 3.6 million samples were examined by pathology laboratories in 2007-08, about 1% fewer than in 2006-07. About 3.4 million (93% of the total) were submitted by GPs or by NHS community clinics - almost all these would be samples taken as part of the screening programme. A further 0.2 million (5%) were from NHS hospitals - most of these were probably samples taken following the discovery of symptoms or cytological abnormality.

**3.1.2** Of the GP and NHS Community Clinic samples examined in 2007-08 for women aged between 25 and 64, 2.9% were inadequate specimens for which no result could be determined, a much lower proportion than in any of the previous years. The proportion of samples found inadequate is falling

for women in all age bands (including the target age range 25-64), apart from the oldest age range, 75 and over where the proportion inadequate has risen slightly to 4.7% in 2007-08. Overall, the proportion of inadequate results was around 6% in the years 1989-90 to 1992-93, but rose in each year to 1999-2000 where it peaked at 9.8%. The percentage stayed at over 9% through until 2006, since then the percentage has continually fallen reaching an all time low of 2.9% in 2007-08 thanks mainly to the introduction of liquid based cytology (LBC), see below. (Figure 6a)

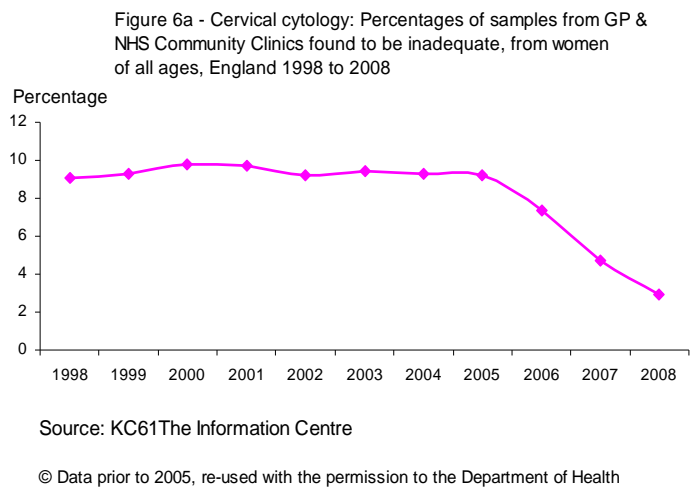

Figure 6 - Cervical cytology: Percentage of samples from GP & NHS Community Clinics found to be inadequate, from women aged 25-64, by laboratory, England 2007-08

Source: KC61 The Information Centre

**3.1.3** At laboratory level, there was wide variation in the proportion of samples judged to be inadequate. The use of liquid based cytology (LBC) began in April 2001 with three pilot laboratories. In October 2003 the National Institute for Clinical Excellence recommended its use nationally. It was expected that the use of LBC would substantially

reduce the proportion of inadequate samples, and figures for recent years confirm this. During 2004-05, a number of laboratories began the conversion to LBC and by the end of 2007-08 all laboratories had converted or had plans in place to convert in the near future. Most laboratories (107 labs) had inadequate results of less than 6%, 11 laboratories had between 6% and 9%, the remainder (6 labs) lay between 9% and 11%, less than last year's peak of 15%. (Figure 6 and 6a)

### 3.2 Results (Tables 15, 16, 16a, and 19)

**3.2.1** The percentage of adequate GP and NHS Community Clinic samples tested in 2007-08 for women aged 25-64, which were reported as being negative was 93.8%. Borderline changes were found in 3.4% of adequate tests, mild dyskaryosis in 1.7%, moderate dyskaryosis in 0.5% and severe dyskaryosis in 0.5%; suspected invasive carcinoma or glandular neoplasia were found in less than 0.1% of samples.

Generally, the older the women the higher the proportion of tests found to be negative, but also the proportion of tests showing suspected invasive carcinoma or glandular neoplasia increases with age. Borderline changes and mild dyskaryosis occurred more frequently in samples from younger women; moderate dyskaryosis accounted for a higher proportion of results from women aged 20-29 than from women in other age groups; the proportion of severe dyskaryosis was highest in samples from women aged 20-34.

**3.2.2** At laboratory level there was wide variation in the percentage distribution of results, in particular in the proportion reported as borderline or mild.

**3.2.3** The distribution of the individual laboratory results is used for quality assurance purposes, as set out in sections 8.2 – 8.4 of the second edition of Achievable Standards for Cervical Cytopathology, NHSCSP publication No 1, May 2000.

Target ranges for laboratory reporting are set from the 10th and 90th percentiles of the distributions of 4 key indicators. The ranges for 2006-07 and 2007-08 are set out in Table A which report on women aged 25-64 tested in GP or NHS Community Clinics and include results from all laboratories. Ranges for 'percentage inadequate' will not be shown until the phased roll out of LBC, which affects the inadequacy rate, is complete.

**3.2.4** Average times from the receipt of the specimen at the laboratory until the authorisation of the report reduced in 2007-08. 49% of tests were reported within 2 weeks of receipt at the lab, up from 43% in 2006-07, a further 34% were reported within 4 weeks (31% in 2006-07). This fall in turnaround

Indicator	10th - 90th percentile range*	
	2006-07	2007-08
Mild / borderline as % of adequate samples	3.4% - 6.8%	3.6% - 7.4%
Moderate or worse as % of adequate samples	0.7% - 1.3%	0.7% - 1.4%
PPV for CIN2 or worse	70.5% - 86.4%	70.7% - 88.9%
<i>Number of laboratories whose results were used</i>	129	124

Source: Form KC61

\* Based on results for women aged 25-64 from GP & NHS Community Clinics

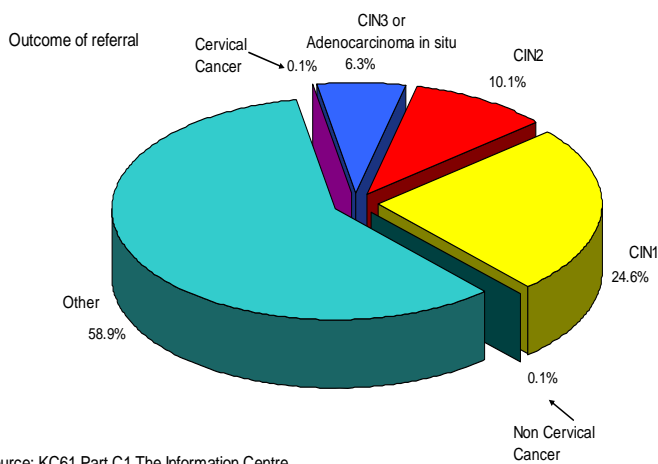

times is probably due to the continued implementation of LBC. Only 3% of tests were reported more than 8 weeks after receipt (5% in 2006-07). At a laboratory level there was wide variation within these timeframes.

### 3.3 Outcome of gynaecological referrals (Tables 18, 18a and 19)

**3.3.1** Information about outcomes of gynaecological referrals for tests registered during April – June 2007 was provided by all laboratories with sizeable numbers of screening programme tests.

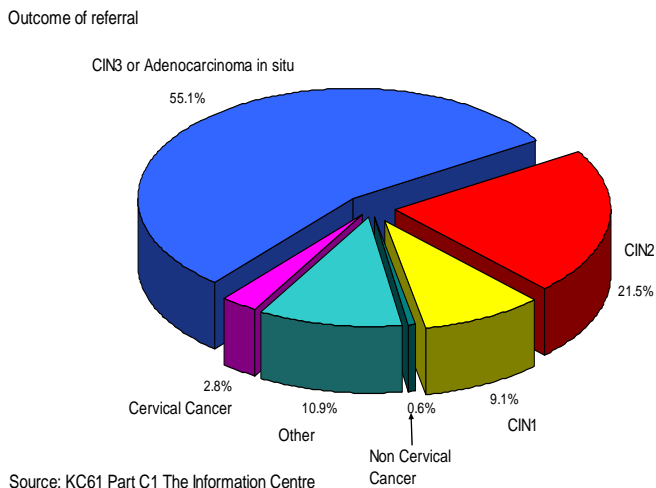

**3.3.2** For women referred following persistent non-negative tests whose referral outcome was known, 0.1% were found to have cervical cancers and 6.3% showed CIN3 or adenocarcinoma in situ; 10.1% showed CIN2 and 24.6% showed CIN1; 11.6%

Figure 7a - Outcome of referral, following persistent non-negative test result, England April 2007 - June 2007

Source: KC61 Part C1 The Information Centre

Figure 7b - Outcome of referral, following single occurrence of potentially significant abnormality, England April 2007 - June 2007

Source: KC61 Part C1 The Information Centre

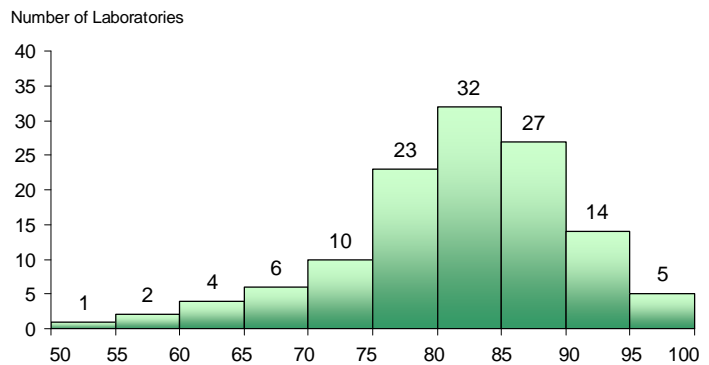

showed HPV only, 13.4% showed no CIN or HPV, 2.0% were inadequate biopsies and in 31.4% no abnormality was detected at colposcopy. Non-cervical cancers were identified from 0.1% of referrals. (Figure 7a)

**3.3.3** For referrals with known outcomes following a single occurrence of a potentially significant abnormality, 2.8% were found to be cervical cancers and 55.1% showed CIN3 or adenocarcinoma in situ; 21.5% showed CIN2 and 9.1% showed CIN1; 2.7% showed HPV only, 4.3% showed no CIN or HPV, 0.6% were inadequate biopsies and in 2.7% no abnormality was detected at colposcopy. Non-cervical cancers were identified from 0.6% of referrals. (Figure 7b)

**3.3.4** A positive predictive value (PPV) was calculated for each laboratory (see 5.4 below for a definition); reported PPVs ranged from 50% to 100% with the majority lying between 69% and 90%. (Figure 8)

**3.3.5** Retrospective information regarding referrals from an earlier complete year was collected again in 2007-08, relating to referrals in the 12 month period April 2006 to March 2007. The results from the whole year (2006-07) were similar to the first quarter of 2007-08.

# Colposcopy

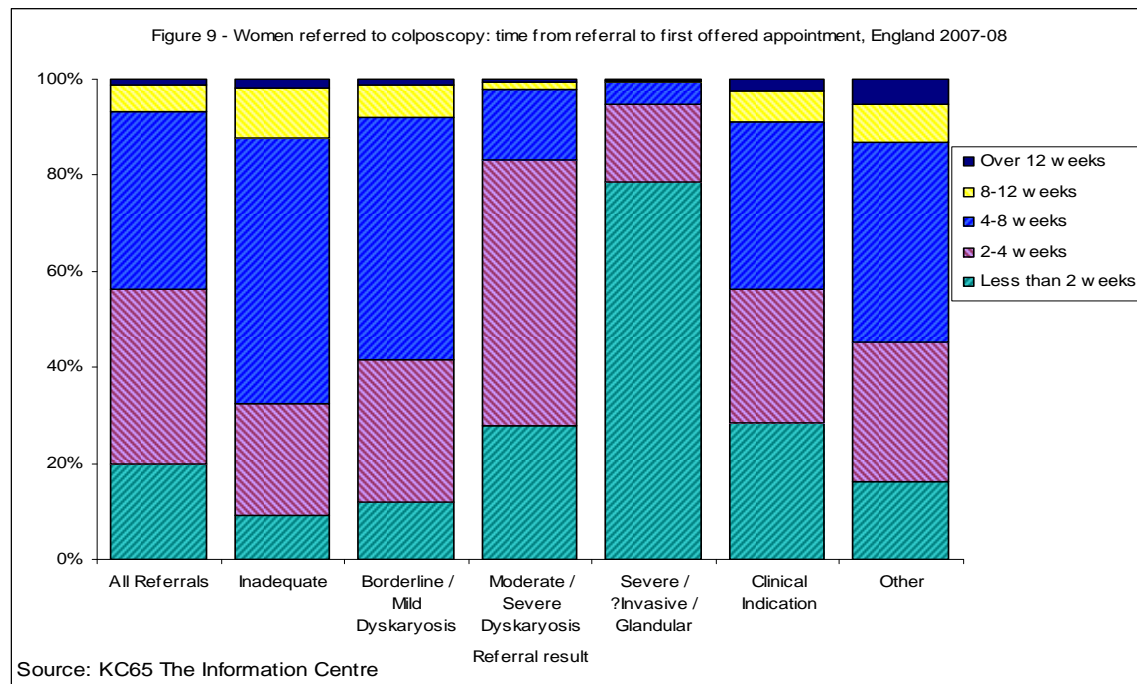

## 4.1 Referrals for colposcopy (Tables 20 and 21)

**4.1.1** Details of the first referrals of each quarter to each clinic were recorded, regardless of whether or not the woman kept her appointment. 122,000 referrals to colposcopy were reported in 2007-08. Of these 80% were reported as being triggered by a screening test and 16% were clinically indicated. Of women referred to colposcopy after a screening test, almost half (48%) followed findings of borderline changes or mild dyskaryosis; about 1 in 7 (14%) referrals followed findings of moderate dyskaryosis and 16% followed findings of severe dyskaryosis or worse.

**4.1.2** Clinics were asked to supply data on the time between the date on the woman's referral letter and her first offered out patient appointment, regardless of whether she attended the appointment or not. Where direct referral systems are in operation, the referral date has been taken to be the date the test was reported. In 2007-08, data shows an improvement over recent years with 20% of women offered an appointment within 2 weeks, rising to 56% within 4 weeks and 93% by 8 weeks from referral. Women with more serious test results tended to be offered appointments earlier; 83% of the women with a result of moderate or severe dyskaryosis were offered an appointment within 4 weeks (an increase of 7% compared with 2006-07). **(Figure 9)**

**4.1.3** There were improvements in almost all regions in the percentage of all women offered an appointment within 8 weeks. Percentages ranged from 88% in South East Coast to 98% in the North East. For those with moderate or severe dyskaryosis the percentage seen within 4 weeks ranged from 73% in South Central to 96% in the North East.

**4.1.4** The time from referral to the first offered appointment was over 12 weeks for 1.4% of women referred. This could be where patients had requested a delayed appointment for personal reasons or where treatment for another condition had to be completed before colposcopy could take place.

## 4.2 Appointments for colposcopy (Table 22)

**4.2.1** During 2007-08 a total of 376,673 appointments were reported at colposcopy clinics, a decrease of 2% from 2006-07. Of these, 40% were new appointments, i.e. all appointments offered for a first visit, 8% were for return for treatment and 52% were follow-up appointments.

**4.2.2** Broadly speaking, out of every 10 new and return for treatment appointments, 8 were attended, 1 was cancelled by the patient and 1 was defaulted (where the patient failed to turn up with no advance warning being given). 2% of new appointments and 2% of return for treatment appointments were cancelled by the clinic.

**4.2.3** Only 66% of follow-up appointments were attended; 13% were cancelled by the patient and 5% by the clinic. In 16% of cases the patients failed to turn up.

## 4.3 First Attendances at colposcopy (Table 23)

**4.3.1** Clinics are required to supply details of all treatment and procedures undertaken at first attendance at the colposcopy clinic. The data collected relate only to procedures

undertaken the first time a woman attends. In the case of deferred treatment the woman will be recorded as having no treatment at her first attendance.

**4.3.2** Just over 116,300 first attendances at colposcopy were reported in 2007-08. Most will relate to a referral in that year, although some women attending may have been referred in a previous year and some of the women referred in this year will attend in the next.

**4.3.3** Overall, 64% women attending had some treatment or procedure at first attendance. For those attending with high-grade abnormalities, the proportion was 84%.

**4.3.4** The most common treatment or procedure at first attendance was diagnostic biopsy. This was carried out at about 46% of all first attendances. The use of this procedure was more common amongst those attending with low-grade abnormalities. For those attending with high-grade abnormalities the most common treatment at first attendance was excision.

**4.3.5** Of women attending with high-grade abnormalities, 45% were treated by excision and 38% had a diagnostic biopsy. Conversely, of those attending with low-grade abnormalities, 58% had a diagnostic biopsy and only 5% underwent excision.

#### **Regional variations:**

**4.3.6** Treatment patterns vary considerably at local and regional level. The percentage of all women receiving some treatment or procedure at first attendance ranged from 52% in the West Midlands to 78% in the North East. Similar patterns are reported in the use of treatment for those attending with both high and low grade abnormalities.

**4.3.7** The use of diagnostic biopsy for those attending with a high-grade abnormality ranged from 24% in the East of England and South Central to 66% in London. For low-grade the equivalent range was 34% in the West Midlands to 78% in the North East.

**4.3.8** The use of excision at first attendance was more common for those attending with a high-grade abnormality. It ranged from 16% in London to 61% in the East of England.

**4.3.9** It is likely that the majority of those women presenting with high-grade abnormalities and reported as having either no treatment or a diagnostic biopsy went on to receive therapeutic treatment at a subsequent attendance.

#### **4.4 Biopsies (Tables 24 and 25)**

**4.4.1** For each biopsy taken, the time elapsing before the woman is informed in writing of her result is recorded. The interval measured is the time between the date on which the biopsy was taken and the date on the letter that is sent to the patient informing her of her result. In order to allow time for follow up of results, the return relates only to those biopsies taken in the first month of each quarter. The data include all biopsies taken, not just those taken from women on first attendance. It is possible that more than one biopsy may be taken from the same woman.

**4.4.2** In 2007-08 almost 41,000 biopsies were reported by clinics in the four sample months. These represent approximately one third of the total annual workload. The woman was informed of her result within 2 weeks in 27% of all cases, with a further 42% being informed within 4 weeks, 3% of women had not been informed of their result within 12 weeks. This figure includes cases where the result had yet to be reported to the clinic. Variations in working practices may account for this delay: for example, where a cytology test has been taken at the same time as a biopsy, the clinic may not report the biopsy result until the cytology result is also known.

**4.4.3** Clinics are asked to supply data on the histological result for each biopsy taken. Of all biopsies reported about 62% were diagnostic, 36% were excision and the remaining 2% were other non-diagnostic biopsies. This is the same as last year.

**4.4.4** Of all non-diagnostic biopsies i.e. excision biopsies and other non-diagnostic biopsies, taken in 2007-08 86% showed evidence of CIN or worse (the same as last year). The proportion ranged from 83.8% in the West Midlands to 90.2% in the North East.

#### 4.5 Clinic data (Tables 26a and Table 26b)

Colposcopy data for individual clinics is shown in Tables 26a and 26b. These may be used to identify different treatment patterns across the country and show wide variation between clinics. Some of this variation may arise from the fact that many clinics deal with only a small number of cases and this should be borne in mind when interpreting the clinic level results.

# Definitions

**5.1 Coverage** is defined as the percentage of women in a population eligible for screening at a given point in time who were less than a specified period (the headline coverage figure relates to 5 years) since their last test producing an adequate test result. Women ineligible for screening, and thus not included in the numerator or denominator of the coverage calculation, are those whose recall has been ceased for clinical reasons (most commonly due to hysterectomy).

**5.2 Local level coverage** is calculated for Primary Care Organisations (i.e. Primary Care Trusts or Care Trusts). Although PCOs do have a defined geographical boundary, the populations used are not those of women resident within the PCO boundaries. Instead the populations of women for whom each PCO is responsible are used. Responsible populations include women on the list of GPs who comprise the PCO, regardless of which geographical PCO they live in; where women on the call/recall register are not under the care of a GP at the time coverage is calculated, they are allocated to a PCO on a geographical basis.

**5.3** The terms “abnormal” and “negative” used in the text to describe the result of a cytology test are defined as follows in terms of the categories used on the cytology report form HMR 101/5:

**Potential cancer:** cat. 5 (severe dyskaryosis/?invasive carcinoma) or cat. 6 (? glandular neoplasia); women who have such test results are usually referred directly for further investigation, e.g. biopsy.

**Abnormal:** HMR 101/5 cat. 4 (severe dyskaryosis), cat. 3 (mild dyskaryosis), cat. 7 (moderate dyskaryosis) or cat. 8 (borderline changes); women who have an abnormal test categorised as result code 3 or 8 will usually be recalled early for another test. Women who have an abnormal test categorised as result code 7 will be referred immediately for further investigation, e.g. colposcopy. Potential cancers are also included.

**Negative:** HMR 101/5 cat. 2 (negative); women with a negative test result will be returned to the screening programme to be called again usually at the normal interval (3 or 5 years).

**5.4 A positive predictive value (PPV)** relating cytology with histology was calculated from outcomes of referral for tests with result moderate dyskaryosis or worse as follows:

**Numerator:**

Number of tests with outcome of referral cancer, adenocarcinoma in situ, CIN3 or CIN2.

**Denominator:**

Number of tests with outcome of referral known and not recorded as inadequate biopsy.

**5.5 CIN (cervical intra-epithelial neoplasia)** CIN is not cancer but an indicator of the depth of abnormal cells within the surface layer of the cervix, and is divided into 3 grades. The higher the number/grade the more severe the condition:

- CIN 1 – one third of the thickness of the surface layer of the cervix is affected.
- CIN 2 – two thirds of the thickness of the surface layer of the cervix is affected.
- CIN 3 – full thickness of the surface layer of the cervix is affected (also known as carcinoma in situ).

**5.6** For definitions of further medical terminology please visit the Cancer Screening Programmes website at [www.cancerscreening.nhs.uk](http://www.cancerscreening.nhs.uk)

**5.7** In the tables:

- .. = Not available
- = Zero

## Further information

This bulletin and copies of the Korner returns KC53, KC61 and KC65 can be found on the Information Centre website at:

[www.ic.nhs.uk/pubs/cervscreen0708](http://www.ic.nhs.uk/pubs/cervscreen0708)

Since 2004/05 this bulletin has been produced by The Information Centre. Previous editions, including those published by the Department of Health, can be found at:

<http://www.ic.nhs.uk/statistics-and-data-collections/screening/cervical-cancer>

Further information about cervical screening is available from the NHS Cancer Screening Programmes:

<http://www.cancerscreening.nhs.uk/>

## INDEX TO TABLES

Table number	Description
1	Summary statistics on cervical cancer and the NHS cervical screening programme, 1998 to 2008
2	Cervical screening programme: test status of women and coverage by age, 31st March 2008
3	Cervical screening programme: test status of women by age (numbers), 31st March 2008
3a	Cervical screening programme: test status of women by age, 31st March 2008
4	Cervical screening programme: number of women invited in the year by type of invitation and age, 2007-08
5	Cervical screening programme: number of women tested in the year by type of invitation and age, 2007-08
6	Cervical screening programme: number of women aged 25-64 tested in the year by type of invitation and result, 2007-08
7	Cervical screening programme: number and percentage of tests in the year by type of invitation and result, 2007-08
8	Cervical screening programme: results of adequate tests by age, 2007-08
9	Cervical screening programme: Time from screening to availability of result by Strategic Health Authority, 2007-08
9a	Cervical screening programme: Time from screening to availability of result by Primary Care Organisation, 2007-08
10	Cervical screening programme: Recall status by most severe screening result and Strategic Health Authority, 2007-08
11	Cervical screening programme: Summary of regional data for women aged 25-64, 2007-08
12	Cervical screening programme: Target Age Group (25-64), results of tests by Primary Care Organisation, 2007-08
13	Cervical screening programme: coverage of the Target Age Group (25-64) by Primary Care Organisation, 2006-07 to 2007-08
14	Samples examined by pathology laboratories, by source of sample and result of test, 2007-08
15	GP & NHS Community Clinic samples examined by pathology laboratories, by result and age of women, 2007-08
16	Samples examined by pathology laboratories: Time from receipt of sample to authorisation of report by region, 2007-08

- 16a Samples examined by pathology laboratories: Time from receipt of sample to authorisation of report by laboratory, 2007-08
  - 17 Samples examined by pathology laboratories, by source of sample, result of test and region, 2007-08
  - 18 Outcome of referrals for samples registered at the laboratory between April 2006 - March 2007, by Strategic Health Authority
  - 18a Outcome of referrals for samples registered at the laboratory between April - June 2007, by Strategic Health Authority
  - 19 GP and NHS Community Clinics samples from women aged 25-64 examined by pathology laboratories, by laboratory and result, 2007-08
  - 20 Women referred to colposcopy: referral indication of first offered appointment, by region 2007-08
  - 21 Women referred to colposcopy: time from referral to first offered appointment, by referral indication and region 2007-08
  - 22 Appointments for colposcopy: attendance status and appointment type, by region 2007-08
  - 23 Women referred to colposcopy: first attendance by result of referral, type of procedure and region 2007-08
  - 24 Biopsies taken at colposcopy: time from biopsy until patient informed of result, by region (4 month sample) 2007-08
  - 25 Non diagnostic biopsies taken at colposcopy: by type, outcome and region (4 month sample) 2007-08
  - 26a Summary statistics by colposcopy clinic, England 2007-08
  - 26b Summary statistics by colposcopy clinic, England 2007- 08
- 
-

<sup>(1)</sup> Percentages are to one decimal place<sup>(2)</sup> The Pathlinks network consists of Diana, Princess of Wales Hospital, Scunthorpe General Hospital, Lincoln County Hospital and Pilgrim Hospital

The cytology activity for the following hospitals has transferred:

Darlington Memorial Hospital to University Hospital of North Durham

Bury &amp; Rochdale to Royal Oldham Hospital

Macclesfield District General Hospital to Mid Cheshire Hospital Foundation Trust

Good Hope Hospital NHS Trust to Heart of England NHS Foundation Trust

The Worcestershire Royal Hospital and the Alexandra Hospital laboratories closed in March 2007. The Gloucestershire Royal Hospital laboratory commenced provision of the cervical cytology services for Worcestershire PCT from 1 April 2007

The Royal Free Hospital joined with University College Hospital, London from 1 September 2007

St Margaret's Hospital to Princess Alexandra Hospital (Harlow) in December 2006
